

# ESCAPE HOOKUPS & PAD FACT SHEET

---

**Pad** - Each ESCAPE unit needs to sit on a firm, flat, level pad. The pad can be concrete, blacktop, crushed rock or gravel...it just needs to be firm and flat and accessible for delivery.

**Power** - Our units require 120v/30a power (never 220/240v power). Here is a picture of the plug & outlet for the unit. We include a 25' power cord (in some cases a standard 120v/20a outlet is sufficient to run the unit).

**Water** - The water inlet is a standard 3/4" hose connection. Use a hose that is designed for drinking water. Good water pressure is essential. We highly recommend using an in line water filter. If you are in a cold climate, please use a heated hose.

**Septic**- The unit has a 3" out for septic...see the picture. We include a 10' flexible hose that ties to this output OR you can simply tie right to the 3" output.

**TV/Cat5**- The unit has an F connector for coax cable...see picture. A Cat5 box is included in the unit and wiring is on the outside for your cable or internet provider. Note: we know many customers may not use these hook ups but they are available.

**LP Gas** - Each ESCAPE unit comes with a functional LP gas system including two 20lb. tanks and an automatic changeover valve.

**Note:** All of these connections are located on the left side of the unit when looking from the back or in the back left corner of the unit. Again, there is a 25' extension cord for power and a 10' hose for septic included.
